How Many Parts Can Be Printed from 1 kg of Filament?

We are often asked “How many parts can you make from a 1 kg roll of filament?”. This is an impossible question to answer due to the type of parts that can be made and the many build strategies that can be applied to a part. The array of parts in the above photos totals 48, some of which are components of a final build like the 18” tall rocket, the airship and the nautilus gears. All of these parts were made from a single 1kg roll of blue PLA. The build time on the 18” rocket was 32 1/2 hours and the rook to the left of the rocket had a build time of 8 Hours and 10 min. The total build time of all of the parts was 84 hours and the programs were run back-to-back without a clogged nozzle, part curling or other failure of any kind.

So are you are looking for **reliability, accuracy, performance, quality and economy** with the ability to print in multiple materials without the requirement to purchase expensive cartridge filaments nor the need to use disposable build plates nor pay for expensive yearly service and maintenance agreements? Then your choice is the Fablicator 3D Printer, a game changer!
